

Perforated Metal

Metalex's broad perforating capabilities make us the best choice for facades, sun shades and a host of unique architectural metal sheet applications. Our perforating die library and high speed presses offer a great range of patterns and open area options, with arrangement of holes widely variable and sizing as small as .5mm and up. While round holes are most common, Metalex can offer other decorative shapes to complete your one-of-a-kind design.

Expanded Metal

Expanded metal is often used for security fencing, lightweight exterior facades, ceiling panels and sun shades. The expanded metal process can be applied over a great range of sizes, from .055" - 1.50" across the diamond. Metalex offers flattened, standard and louver patterns in myriad materials.
